

Wingman

Never miss the small things that keep a consultant's day running.

Wingman is a reminder dashboard built for consultants. It keeps your daily routines, such as time reporting in BLIKK, stand-ups, expenses and breaks, on a clear timeline. When it's time, it chimes and asks you to act. You acknowledge the reminder or snooze it, and get back to client work.

Next.js 16

Tailwind CSS 4

Supabase

Deploys on Vercel

Works on desktop & mobile

THE PROBLEM

Client work is loud. Admin is quiet, until it's late.

A consultant's day is split between client meetings, delivery work and internal routines. The client work always gets attention. The recurring admin that keeps the business running is easy to forget: reporting hours, updating the task board, sending the weekly status, submitting expenses.

Late time reports

Hours reported from memory at the end of the week are less accurate. Missing reports hold up invoicing and lead to reminders from the back office.

Mental load

Keeping "don't forget to..." in your head all day costs focus you'd rather spend on the client.

Generic tools

Calendar alerts and to-do apps aren't built around a daily consultant routine. They get noisy, or they get ignored.

One tab. Your whole routine. A nudge at the right moment.

1

Set up your routine

Add reminders with a title, description and time, and choose how often each one repeats. Or start from the built-in consultant routine in one click.

2

See your day

The dashboard shows what's next, a countdown, and a timeline of today's reminders marked Upcoming, Due now, Snoozed, Done or Passed.

3

Get nudged

At the scheduled time, an alarm dialog opens with a chime. If the tab is in the background, you also get a browser notification.

4

Act or snooze

Click "Done" to acknowledge it, or snooze for 5, 10, 15 or 30 minutes. Wingman comes back when the snooze ends.

A DAY WITH WINGMAN

A consultant's routine, ready from the start.

Wingman comes with a suggested routine for a consultant's working day. Load it with one click, then adjust it to your client and team.

TIME	REMINDER	WHAT IT PROMPTS YOU TO DO	REPEATS
08:30	Check email & Teams	Scan inbox and channels for anything urgent before the day starts.	Weekdays
09:15	Daily stand-up	Join the client stand-up. Prepare: yesterday, today, blockers.	Weekdays
12:00	Lunch break	Step away from the screen and eat something.	Daily
14:00	Weekly status to client	Send a short update: done, next, risks.	Fridays, off by default
14:30	Stretch & drink water	Short break: stand up, stretch, refill your water bottle.	Weekdays
15:00	Submit weekly expenses	Upload receipts and submit expenses and travel for the week.	Fridays
15:30	Update task board	Move tickets in Jira or Azure DevOps and comment on progress.	Weekdays
16:30	Time reporting in BLIKK	Report today's hours in BLIKK per project and activity, while the day is still fresh.	Weekdays
16:45	Plan tomorrow	Write down the top three priorities for tomorrow.	Weekdays

Everything a reminder system needs.

Manage reminders

- **Create** reminders with title, description and time.
- **Edit** any reminder: title, description, time or how often it repeats.
- **Delete** with a confirmation step, so nothing goes by accident.
- **Activate or deactivate** with one switch. Paused reminders stay saved but leave today's schedule.
- **Filter** the list: All, Active or Inactive.

Flexible recurrence

- **Daily**: every day, e.g. lunch break.
- **Weekdays**: Monday to Friday, e.g. BLIKK time reporting.
- **Custom days**: any chosen weekdays, e.g. Fridays for expenses.
- **Once**: a single date, e.g. a deadline or a one-off meeting.

Alarms that are hard to miss

- Popup dialog with a chime that repeats every 20 seconds until you respond.
- Browser notification when Wingman is in a background tab (after you allow notifications).
- The tab title shows how many reminders are waiting, e.g. (2) Wingman .
- Several due reminders are queued and shown one at a time.
- Opened the app late? Reminders up to an hour overdue still pop up. Older ones are marked Passed instead of flooding you.

Made to be pleasant

- "Next up" card with a live countdown, plus counts of active, remaining and done reminders.
- "Test alarm" on every reminder, to preview the popup and sound.
- Responsive layout for laptop, tablet and phone. Light and dark mode follow your system.
- Keyboard support and accessible switches and dialogs.
- Demo mode: runs without a database, saving reminders in the browser, so you can try it right away.

GOOD TO KNOW

Clear about scope.

Wingman is intentionally focused. To set the right expectations:

- Alarms go off while Wingman is open in a browser tab, so keep it pinned. Browsers only play sound after you've clicked on the page once.
- Reminders are stored in Supabase. Whether you've acknowledged or snoozed a reminder is kept per device, in the browser.
- There is no login yet, so anyone with the URL can manage the reminders. For personal use, protect the deployment with Vercel Deployment Protection.

Possible next steps: user accounts with personal reminders (Supabase Auth), push notifications when the tab is closed, and direct links to BLIKK from a reminder.

Modern, lean and secure by design.

Architecture

- **Next.js 16 (App Router)** with React 19 and TypeScript.
- **Tailwind CSS 4** for a clean, consistent interface.
- **Supabase (Postgres)** stores the reminders.
- **REST API routes:** `GET/POST /api/reminders` and `PUT/PATCH/DELETE /api/reminders/:id`.
- The alarm logic runs in the browser and checks once a second, in the user's local time zone.
- **One clear table**, `reminders`: title, description, time, recurrence, days_of_week, one_time_date, active, timestamps. Schema and sample data come as ready-to-run SQL.

Security & robustness

- The browser never talks to the database directly. Only the server uses the Supabase secret key.
- Row Level Security is on, with no public policies, so the public key can't read or change data.
- All input is validated on the server: required title, valid time, valid recurrence, length limits.
- Misconfigured settings are tidied automatically (e.g. a URL pasted with `/rest/v1`). Errors are explained in plain language.
- `npm run check:supabase` checks the connection, key and table in seconds.

GET STARTED

From repository to live app in minutes.

- 1 **Try it locally:** `npm install` then `npm run dev`. Without database settings it starts in demo mode with the sample routine loaded.
- 2 **Create a Supabase project** and run `supabase/schema.sql` (and optionally `seed.sql`) in the SQL editor.
- 3 **Import the repository in Vercel** and add two environment variables: `SUPABASE_URL` and `SUPABASE_SECRET_KEY`.
- 4 **Deploy**, open the app in a pinned browser tab, allow notifications, and let Wingman handle the reminders.

Let Wingman keep track of the small things.

Report your hours on time, keep your team and client up to date, and remember to take breaks, without keeping it all in your head. Wingman keeps your routine visible and reminds you at the right moment.

Wingman: your co-pilot for the working day.
